DEC 18 2006

1. REAL PARTY IN INTEREST

The real party in interest in this matter is Intel Corporation. (Recorded November 9, 2000; Reel/Frame 011535/0333).

2. RELATED APPEALS AND INTERFERENCES

There are no related appeals.

3. STATUS OF THE CLAIMS

Claims 1-19 are pending in the application. Claims 1, 3-8, 12-15 and 17-19 are rejected under 35 U.S.C. §103(a) as being unpatentable over Patel et al., *Improving Trace Cache Effectiveness with Branch Promotion and Trace Packing*, in further view of Johnson, U.S. Patent No. 5,924,092. Claims 2, 9-11 and 16 are rejected under 35 U.S.C. §103(a) as being unpatentable over Patel, in further view of Johnson, in further view of Peled et al., U.S. Patent No. 6,076,144.

4. STATUS OF AMENDMENTS

The claims listed on page A-1 of the Appendix attached to this Appeal Brief reflect the present status of the claims.

5. SUMMARY OF THE CLAIMED SUBJECT MATTER

The embodiment of claim 1 generally describes a cache comprising: a cache line to store an instruction segment (*see e.g.*, page 5, lines 4-7 – Figure 2, 210) further comprising a plurality

Application No. 09/708,722
Appeal Brief dated December 16, 2006

of instructions stored in sequential positions of cache line in reverse program order (*see e.g.*, page 5, lines 23-24).

The embodiment of claim 5 generally describes a segment cache for a front-end system in a processor (*see e.g.*, page 5, lines 4-7 – Figure 2, 210), comprising a plurality of cache entries to store instructions of instruction segments in reverse program order (*see e.g.*, page 5, lines 21-24 – Figure 2, 210 and Figure 4, 440).

The embodiment of claim 8 generally describes a method comprising building an instruction segment based on program flow (*see e.g.*, page 5, lines 14-15), and storing instructions of the instruction segment in a cache entry in reverse program order (*see e.g.*, page 5, lines 21-24 – Figure 2, 210 and Figure 4, 440).

The embodiment of claim 14 generally describes a processing engine, comprising: a front end stage to build and store instruction segments (*see e.g.*, page 4, lines 3-12 – Figure 2, 200), instructions provided therein in reverse program order (*see e.g.*, page 5, lines 21-24 – Figure 2, 210 and Figure 4, 440), and an execution unit in communication with the front end stage (*see e.g.*, page 4, lines 10, 17, 22 and 24).

FIG. 1 is a block diagram illustrating the process of program execution in a conventional processor. FIG. 2 is a block diagram of a front end processing system according to an embodiment of the present invention. FIG. 3 is a block diagram of a segment cache according to an embodiment of the present invention. FIG. 4 illustrates a relationship between exemplary segment instructions a cache bank according to the embodiments of the present invention.

Application No. 09/708,722
Appeal Brief dated December 16, 2006

6. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

A. Are claims 1, 3-8, 12-15 and 17-19 unpatentable over Patel et al., *Improving Trace Cache Effectiveness with Branch Promotion and Trace Packing*, in further view of Johnson, U.S. Patent No. 5,924,092?

B. Are claims 2, 9-11 and 16 unpatentable over Patel et al., *Improving Trace Cache Effectiveness with Branch Promotion and Trace Packing*, in further view of Johnson, U.S. Patent No. 5,924,092, in further view of Peled et al., U.S. Patent No. 6,076,144?

7. ARGUMENT

A. Claims 1, 3-8, 12-15 and 17-19 are not unpatentable over Patel in further view of Johnson.

Applicants submit the cited references do not teach, suggest or disclose at least “[a] cache comprising: a cache line to store an instruction segment further comprising a plurality of instructions stored in sequential positions of the cache line in reverse program order” (e.g., as described in claim 1)

The Examiner asserts that it would be obvious to modify the instruction segment of Patel with the teaching of Johnson in order to store instructions of an instruction trace in reverse order “so that the frequently accessed and modified head of the trace will be moved and modified fewer times so that performance is improved.” See Office Action dated 6/16/2006, paragraph 6.

Applicants respectfully disagree. Applicants submit in order to establish *prima facie* obviousness, there must be some suggestion or motivation to modify the reference or combine the reference teachings. For at least the following reasons, there is no such suggestion or motivation here.

Application No. 09/708,722
Appeal Brief dated December 16, 2006

Patel discloses the improvement of fetch rates in trace caches by employing branch promotion and trace packing. Branch promotion removes the overhead resulting from dynamic branch prediction by applying static branch prediction to strongly biased branches. Trace packing packs as many instructions as possible into a pending trace so that more instructions segments may be fetched during a single fetch cycle. However, Patel neither teaches nor suggests that the fetch rates may be improved by reversing the order of the instructions in the traces. Applicants submit there would be no motivation to do so, since reversing instruction order would not appear to improve fetch rates given the teaching of Patel.

By definition, a trace is a sequence of dynamically executed instructions, which may originally reside in non-continuous portions of the program memory, starting with a single entry instruction and ending with multiple exit instructions. For a typical trace, the head of the trace, *i.e.*, the first instruction in a sequence, is followed by the next executable instruction in the sequence, then the next, and so on. If the Examiner's assertions (discussed above) are correct, the first instruction is accessed and modified more than the second, third, etc., instructions. This is contrary to the known operation of the typical trace.

Applicants submit it is unclear how accessing the first instruction in a trace more frequently than the second instruction, and accessing the second instruction more frequently than the third, and so on, would improve the performance of a trace (thereby eliminating any motivation to do so). Since the trace defines sequential instructions, which perform a particular operation, accessing the instructions in decreasing frequency would in no way advance the completion of the particular operation. Indeed, such access of the trace would hinder the completion, thereby defeating the purpose of the trace.

Application No. 09/708,722
Appeal Brief dated December 16, 2006

Moreover, it is unclear how modifying the first instruction in a trace more frequently than the second instruction, and modifying the second instruction more frequently than the third, and so on, would improve the performance of a trace. Again, since the trace defines sequential instructions, which perform a particular operation, modifying the instructions in decreasing frequency would in no way advance the completion of the particular operation. Indeed, such modification would result in a different operation, thereby, defeating the purpose of the trace. Therefore, the Examiner's asserted motivation for modifying Patel with Johnson does not apply.

Furthermore, even if the head of the trace could be more frequently accessed and modified, the Examiner has provided no explanation of how such would improve the fetch rates of the trace cache of Patel.

As stated previously, there is no motivation to reverse the instructions in a Patel trace. Patel discloses using branch promotion to improve cache fetch rates. The purpose of branch promotion is to reduce the dynamic branching of strongly biased traces by applying static branches (or predictions). Applicants submit reversing the instructions so that the first instruction is listed last in the trace does not improve the branch promotion technique. Reversing the instructions does not reduce the dynamic branching of strongly biased traces. Moreover, it does not improve the fetch rates. As such, there is no reason a person of ordinary skill in the art would be motivated to reverse the instructions in a trace, while using branch promotion, to improve fetch rates.

Patel also discloses using trace packing to improve cache fetch rates. The purpose of trace packing is to increase the number of instructions fetched per fetch cycle. However, Applicants submit reversing the instructions so that the first instruction is listed last in the trace does not improve the trace packing technique. Moreover, such does not appear to improve the

Application No. 09/708,722
Appeal Brief dated December 16, 2006

fetch rates. As such, a person of ordinary skill in the art would not be motivated to reverse the instructions in a trace, while using trace packing, to improve fetch rates.

Applicants further respectfully disagree with the Examiner's assertion that Johnson has taught that the static sorting algorithm stores elements in reverse order, since it stands to reason that the elements first added to the array would be accessed and used before the elements most recently added to the array. *See* Office Action dated 12/2/2005, page 11, paragraph 43, lines 1-3. Applicants disagree with the assertion and the associated rationales are found in paragraph 43. Applicants note the Examiner does not cite to any specific section of Johnson to support its assertion. *See* Office Action dated 6/16/2006, paragraph 40. Therefore, Applicants submit the claim that Johnson provides a motivation to combine its teaching with Patel is unsupported and erroneous.

However, previously in discussing Johnson, the Examiner cited column 4, lines 13-24.

Column 4, lines 13-24 of Johnson state:

For the illustrated embodiment discussed below, a static sorting algorithm is used which arranges the logical blocks of data in a logical page in reverse order, thereby placing the last logical block at the beginning of the array, and the first logical block at the end. Consequently, *the more frequent modifications* to the data in the first logical block require recompression and/or moving of fewer, or no other, subsequent frames than the *less frequent modifications* to the data in the last logical block of a page. In general, this results in a lower average number of *updated frames per data modification*, and thus improved overall performance. (*emphasis added*)

The cited section discusses improving overall performance based upon lowering the average number of update frames *per modification* in a data array. The cited section does not, however, discuss improving overall performance during *accessing* or *using* data in a data array. *Accessing* data or *using* data is not the same as *modifying* data. Modifying may be characterized as writing new data over old data in a data array (i.e., changing the data array), while accessing or using

Application No. 09/708,722
Appeal Brief dated December 16, 2006

data may be characterized as loading and utilizing the data in the data array in its current state. The two are distinct concepts. The cited section of Johnson does not discuss the benefits of its sorting algorithm during data access or data "use" at all. To argue that "modifying" data, allegedly necessitates and therefore is the equivalent of "accessing" or "using" data is to eviscerate the meaning of concepts and functions readily known to those of ordinary skill in the art as being separate and distinct. *See* Office Action dated 6/16/2006, paragraph 48.

In fact, the Johnson reference is not directed toward improving performance during data access or use at all, but rather limited to discussing improving performance during data modification. Nevertheless, the Examiner asserts:

Johnson has taught that the static sorting algorithm stores elements in reverse order, since it stands to reason that the elements first added *to the array would be accessed and used* before the elements most recently added to the array. (*emphasis added*) *See* Office Action, paragraph 43, lines 1-3.

and

Johnson has taught that entries that were placed at the beginning of an array, *e.g.* placed first within the array, *are more likely to be accessed first*, so, by placing these elements at the end of an array where there are less elements dependent on that one particular element to be made when the elements are modified, such as when Patel's instruction segments are fetched in split groups, less time is required to update the element. (*emphasis added*) *See* Office Action, paragraph 43, lines 14-18.

Applicants submit that these overbroad assertions are erroneous and unsupported by the Johnson reference. Applicants submit the related assertions based upon these interpretations of Johnson found in paragraph 43 of the Examiner are erroneous as well, and insufficient to support a proper teaching, suggestion or motivation to combine the teachings of Patel and Johnson.

The Examiner counters by citing to column 4, lines 27-29 in Johnson ("...it should be appreciated that the elements may represent practically any types of memory blocks or segments, having any fixed or variable size.") *See* Office Action dated 6/16/2006, paragraph 42. A generalized statement of Johnson's ability to apply its system to larger memory blocks of fixed

Application No. 09/708,722
Appeal Brief dated December 16, 2006

or variable size is not a sufficient motivation to combine when considering, as shown above, the teachings of Johnson are functionally incompatible with those of Patel. To argue that despite the fact the Johnson reference teaches away from combining with the Patel reference, one would still be motivated to combine them in such a manner is unsupported and inadequate.

The Examiner further asserts the last sentence of the cited section column 4, lines 13-24 provide the necessary motivation to combine the teachings of Patel and Johnson (citing specifically "...In general, this results in a lower average number of updated frames per data modification, and thus improved overall performance.") See Office Action dated 6/16/2006, paragraph 38. Applicant disagree, and submit a generalized statement directed toward a purported "improvement" on the prior art is not sufficient to supply a *motivation to combine*. Otherwise every patent application purporting to improve upon the prior art may on its face arguably offers a motivation to combine. Clearly this is not the case.

Applicants maintain that a person of ordinary skill in the art would not be motivated to reverse the instructions in a trace, while using trace packing, to improve fetch rates and that as such, claim 1 is allowable in its present form. Independent claims 5, 8 and 14 contain similar allowable limitations, and are therefore allowable for similar reasons. Claims 2-4, 7, 9-13 and 15-19 are allowable for depending from allowable base claims.

B. Claims 2, 9-11 and 16 are not unpatentable over Patel, Johnson and in further view of Peled.

The deficiencies are not corrected by Peled. Peled discloses a cache organized around trace segments of the running programs rather than an organization based on memory addresses. However, Peled fails to provide any motivation for modifying Patel with Johnson. Moreover,

Application No. 09/708,722
Appeal Brief dated December 16, 2006

there is no motivation disclosed to modify Patel with Johnson and Peled to arrive at the claimed invention. Accordingly, the Examiner has failed to establish a *prima facie* case of obviousness over Patel in view of Johnson in further view of Peled.

CONCLUSION

For at least these reasons, the Claims 1-19 are believed to be patentable over the cited references, individually and in combination. Withdrawal of the rejections is, therefore, respectfully requested.

Appellant therefore respectfully requests that the Board of Patent Appeals and Interferences reverse the Examiner's decision rejecting claims 1-19 and direct the Examiner to pass the case to issue.

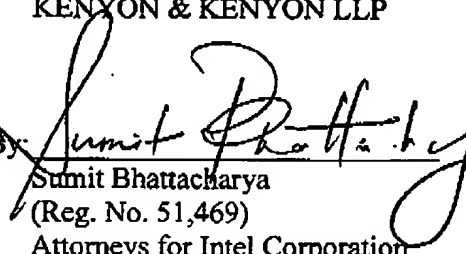

The Examiner is hereby authorized to charge any additional fees which may be necessary for consideration of this paper to Kenyon & Kenyon Deposit Account No.

11-0600.

Respectfully submitted,

APPENDIX
(Brief of Appellants Stephen J. Jourdan et al.
U.S. Patent Application Serial No. 09/708,722)

8. CLAIMS ON APPEAL

1. A cache comprising:

a cache line to store an instruction segment further comprising a plurality of instructions stored in sequential positions of cache line in reverse program order.
2. The cache of claim 1, wherein the instruction segment is an extended block.
3. The cache of claim 1, wherein the instruction segment is a trace.
4. The cache of claim 1, wherein the instruction segment is a basic block.
5. A segment cache for a front-end system in a processor, comprising a plurality of cache entries to store instructions of instruction segments in reverse program order.
6. Apparatus comprising:

an instruction cache system,

an instruction segment system, comprising:

a fill unit provided in communication with the instruction cache system,

the segment cache of claim 5 included therein, and

a selector coupled to an output of the instruction cache system and to an output of the segment cache.

Applicatio No.: 09/708,722
Appeal Brief dated December 16, 2006

Attorney Docket No. 2207/9800

7. Apparatus of claim 6, wherein the instruction segment system further comprises a segment predictor provided in communication with the segment cache.

8. A method comprising:

building an instruction segment based on program flow, and
storing instructions of the instruction segment in a cache entry in reverse program order.

9. The method of claim 8, further comprising:

building a second instruction segment based on program flow, and
if the first and second instruction segments overlap, extending the first instruction segment to include non-overlapping instructions from the second instruction segment.

10. The method of claim 9, wherein the extending comprises storing the non-overlapping instructions in the cache in reverse program order in successive cache positions adjacent to the instructions from the first instruction segment.

11. The method of claim 8, wherein the instruction segment is an extended block.

12. The method of claim 8, wherein the instruction segment is a trace.

13. The method of claim 8, wherein the instruction segment is a basic block.

Applicatio No.: 09/708,722
Appeal Brief dated December 16, 2006

Attorney Docket No. 2207/9800

14. A processing engine, comprising:

a front end stage to build and store instruction segments, instructions provided therein in reverse program order, and

an execution unit in communication with the front end stage.

15. The processing engine of claim 14, wherein the front-end stage comprises:

an instruction cache system,

an instruction segment system, comprising:

a fill unit provided in communication with the instruction cache system,

a segment cache, and

a selector coupled to an output of the instruction cache system and to an output of the segment cache.

16. The processing engine of claim 15, wherein the instruction segments are extended blocks.

17. The processing engine of claim 15, wherein the instruction segments are traces.

18. The processing engine of claim 15, wherein the instruction segments are basic blocks.

19. The processing engine of claim 15, wherein the instruction segment cache system further comprises a segment predictor provided in communication with the segment cache.
